

# PROJECT OF A CATALOGUE OF YUGOSLAV SUNDIALS

MILUTIN TADIĆ

*Faculty of Sciences, Priština, Yugoslavia*

**Abstract.** Twelve years ago our astronomers accepted an idea to elaborate a catalogue of the sundials. The catalogue has not been compiled so far because of the known circumstances – the country of twelve years before doesn't exist any more. Now, it isn't hard to compose the catalogue of our sundials. First – the expected number of sundials isn't great, second – there are some European catalogues and one should only follow their example. In that sense, following European experience, it seems most practical to form a section for gnomonic in our Astronomical Society and entrust it with the realization of such a catalogue.

The number of our sundials will not be nearly the number of sundials in the West-European countries, but only the existing Roman sundial from Sirmium and the medieval sundial from monastery Studenica, are sufficient reason for getting started our catalogue.
