VISIBLE AND INVISIBLE IN CYBERSPACE

In the past half of century in world happened more changes than in past fifty thousand years. Huge number of technological discoveries, very fast and unexpectedly changed traditional forms of communications, which was opened perspectives of virtual production, interaction and management of information. Under the process of meta-media convergence withdraw traditional forms of communication and redesign conventional concepts of space and time. Integration of Internet, micro-chips, television, satellite program, mobile telephones, multimedia and computer networks produced media integration which is unknown in previous development of civilization. Global network opened perspectives to unlimited interactions between people, places and events in their private and public life, but only communicative intelligent communities and individuals will be able to enjoy in benefits of transformed information environment. Individuals, events, phenomena and processes are not significant by it selves, but to their existing in public space for which gates opens keepers of power, because they control constructing of social politics, art, management, etc. Highly developed countries, in which new media and virtual technology are already implemented, already enjoy significant advantage over the rest of the world, because by forming the future according to their needs, they generate relations between reality and abstraction. Constantly active system of informational mobility enables contact with all, everywhere in the planet, but maybe in universe too?
