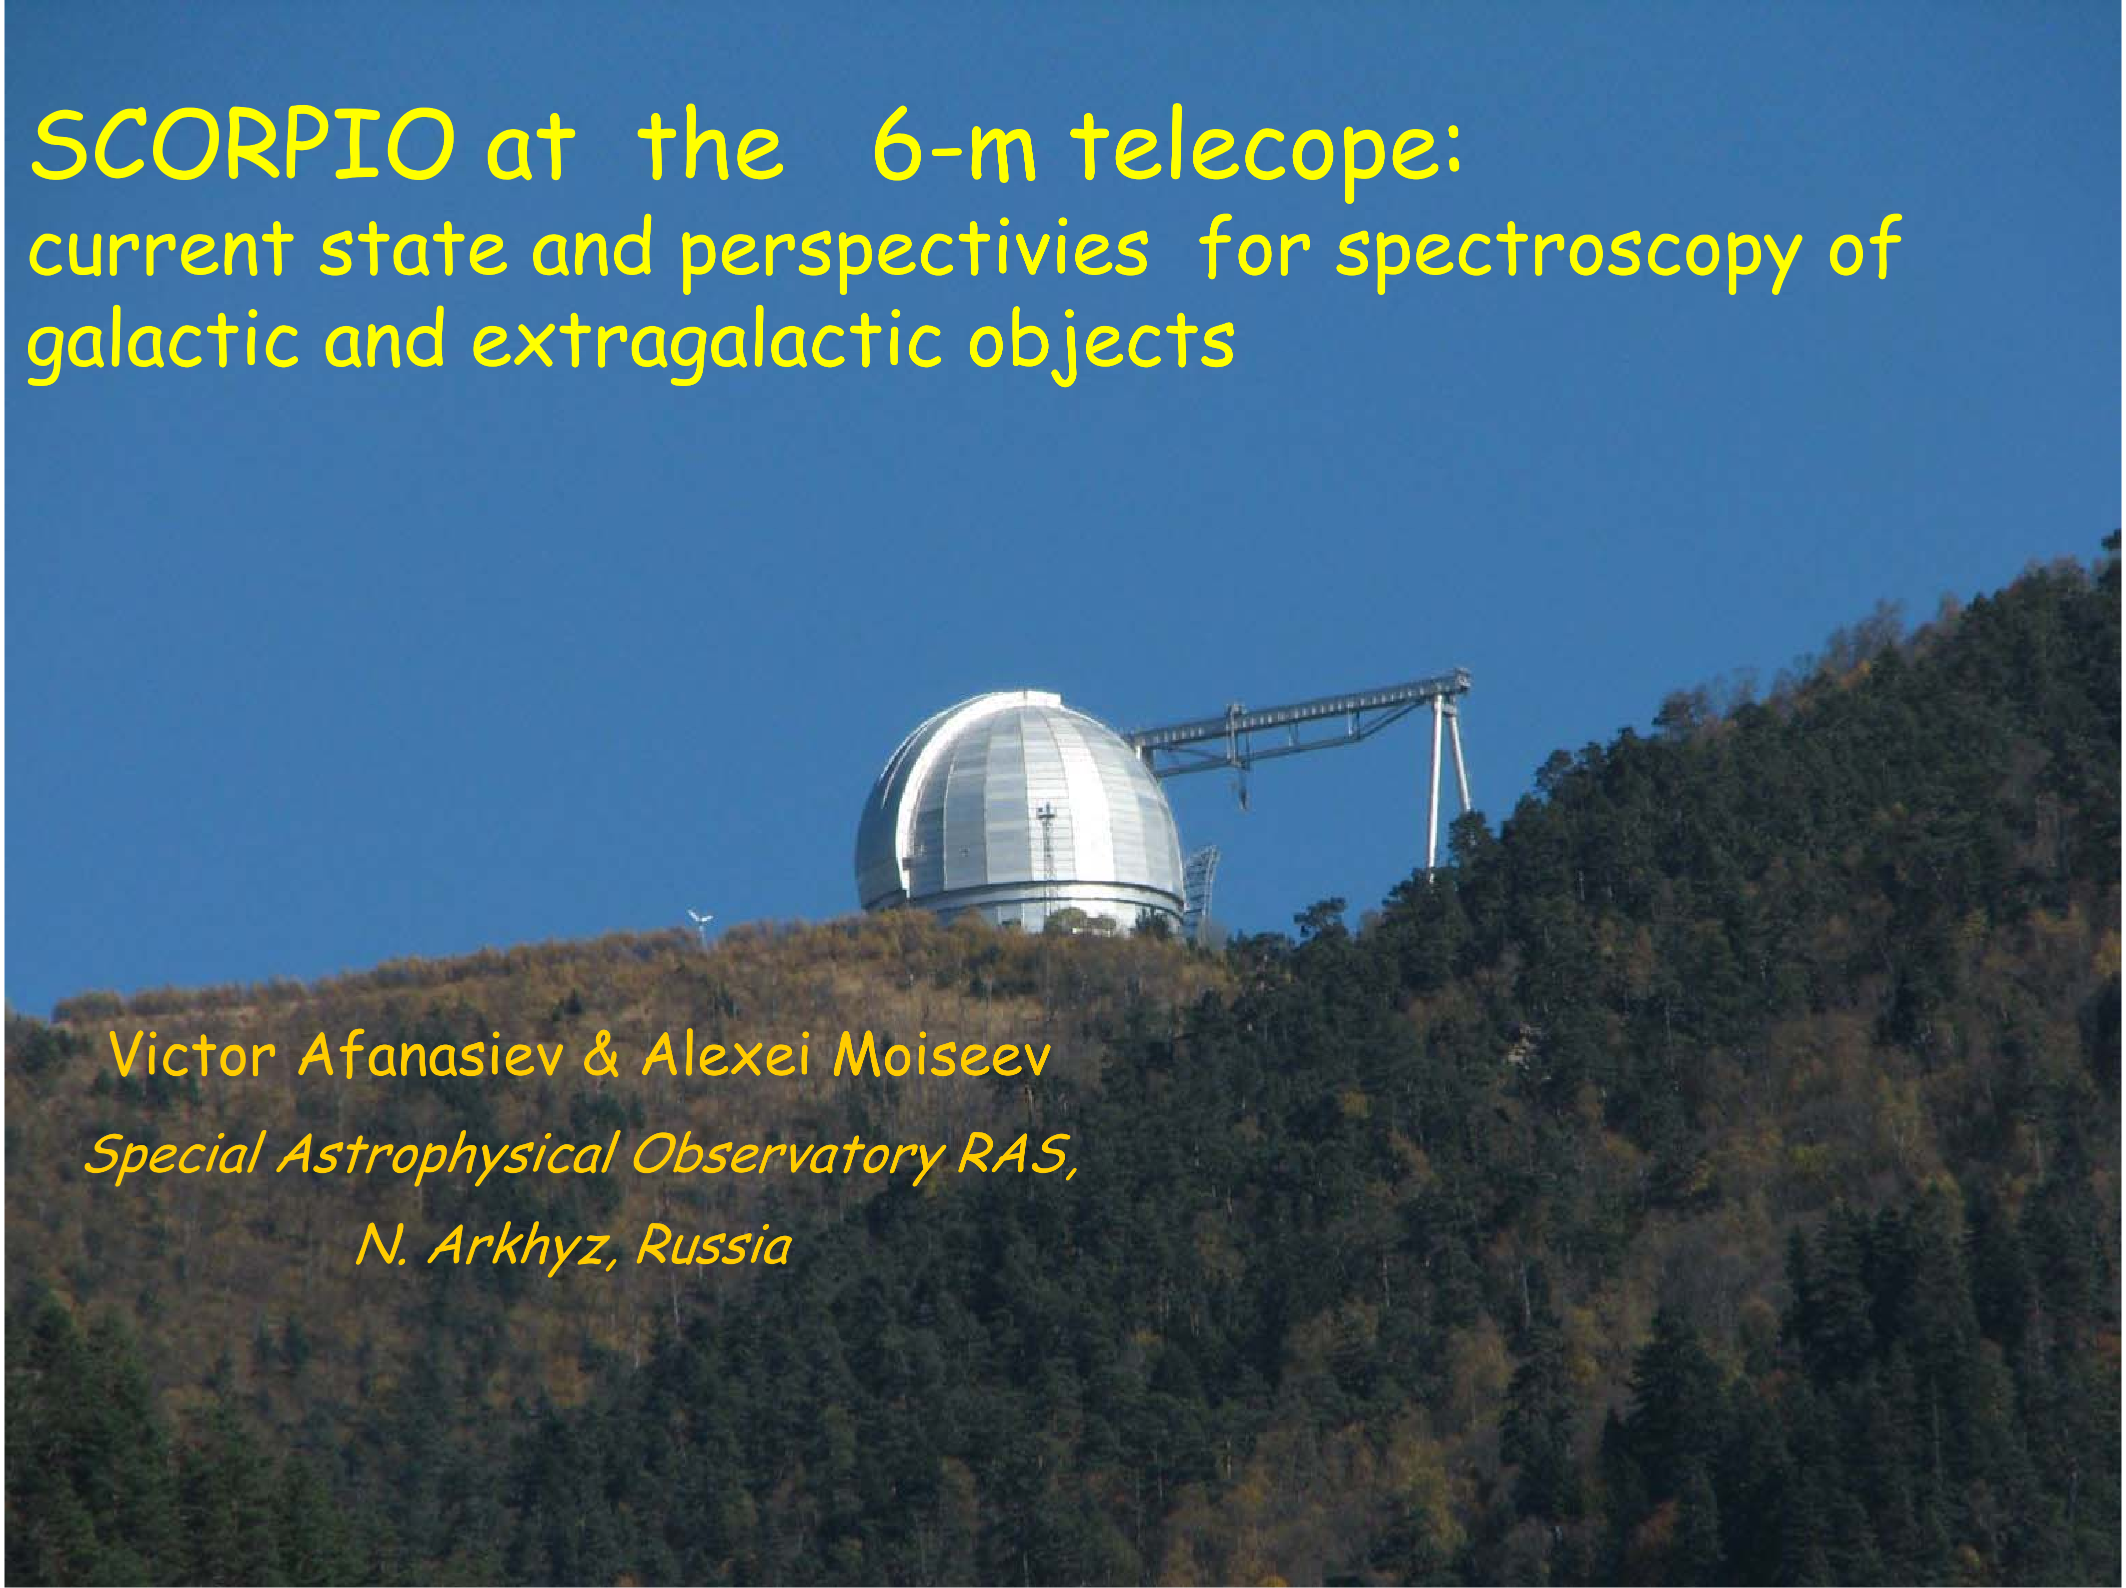
SCORPIO at the 6-m telecope:
current state and perspectivies for spectroscopy of galactic and extragalactic objects



Victor Afanasiev & Alexei Moiseev

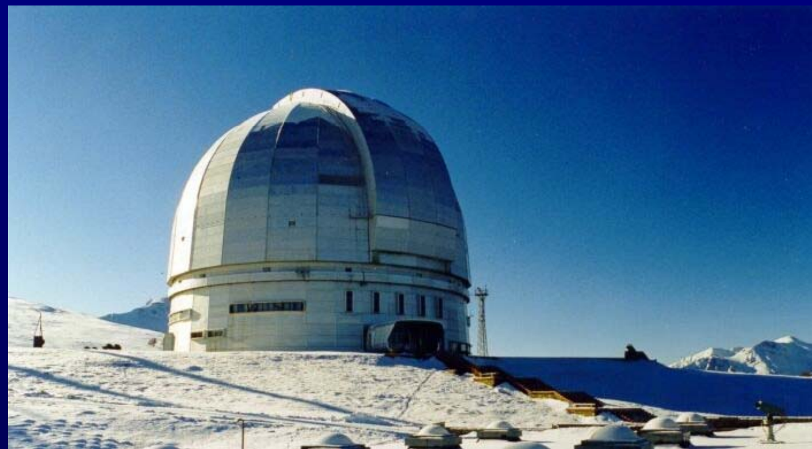
Special Astrophysical Observatory RAS,

N. Arkhyz, Russia

The 6m telescope BTA

Big Telescope Alt-azimuthal (BTA) is the principal instruments of the Special Astrophysical Observatory (SAO) Russian Academy of Sciences.

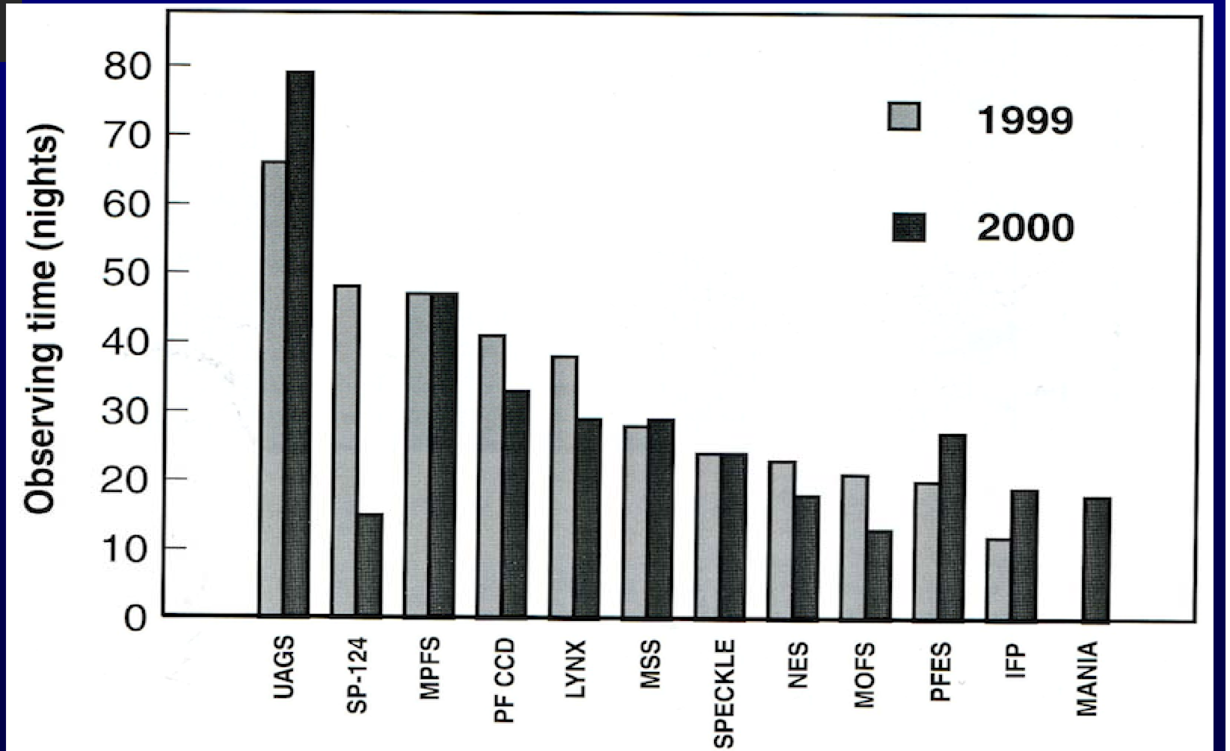
Main mirror diameter	6 m
Focal ratio	(F/4)
First light	1976
Location:	Northern Caucasus
Mean seeing:	1.5"



http://www.sao.ru

Typical distribution of the observing time:

SAO astronomers: ~40%
Other Russian institues: ~30%
Former USSR countries: ~10%
Other countries: ~20%



In 2000 we had 11 observational methods (8 in the prime focus).

A multi-mode instrument is necessary!

The family of 'faint objects cameras'

The idea of a focal reducer for a large telescope – Courtes (1960)

EFOCS/ESO 3.6 m (Buzoni et al., 1984) = 8(!) observing modes

ESO Faint Object Spectrograph and Camera,

- direct imaging,
- long-slit,
- slitless,
- echelle,
- imaging polarimetry,
- spectropolarimetry,
- coronography,
- Multiple Object Spectroscopy

The modern devices for 2-10 m telescopes:
AFOCS, DFOSC, FORS2, DOLLORES..

FORS2 (VLT 8.2m)

J. BLAND AND R. B. TULLY: THE HIFI

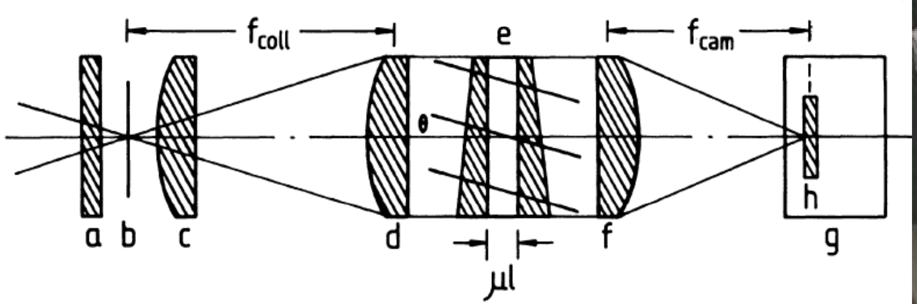


FIG. 1. Schematic drawing of an imaging Fabry–Perot interferometer comprising (a) interference filter, (b) focal plane, (c) field lens, (d) collimator lens, (e) Fabry–Perot etalon, (f) camera lens, (g) Dewar housing, (h) CCD.

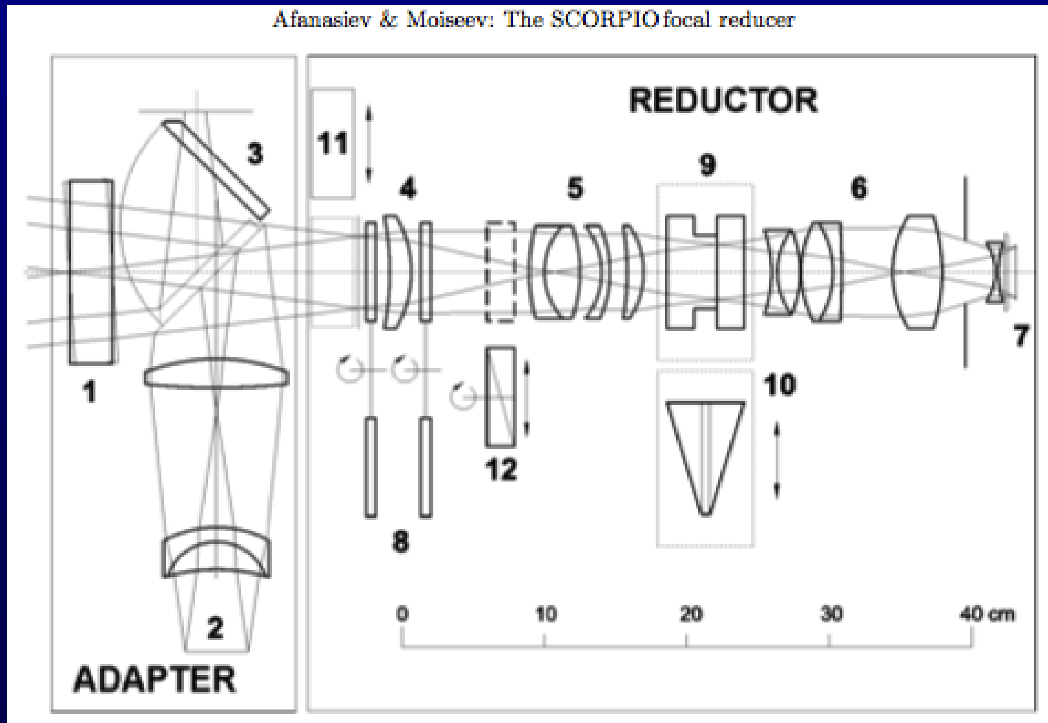
AFOCS (Asiago 1.82m)

Spectral Camera with Optical Reducer for Photometric and Interferometric Observations

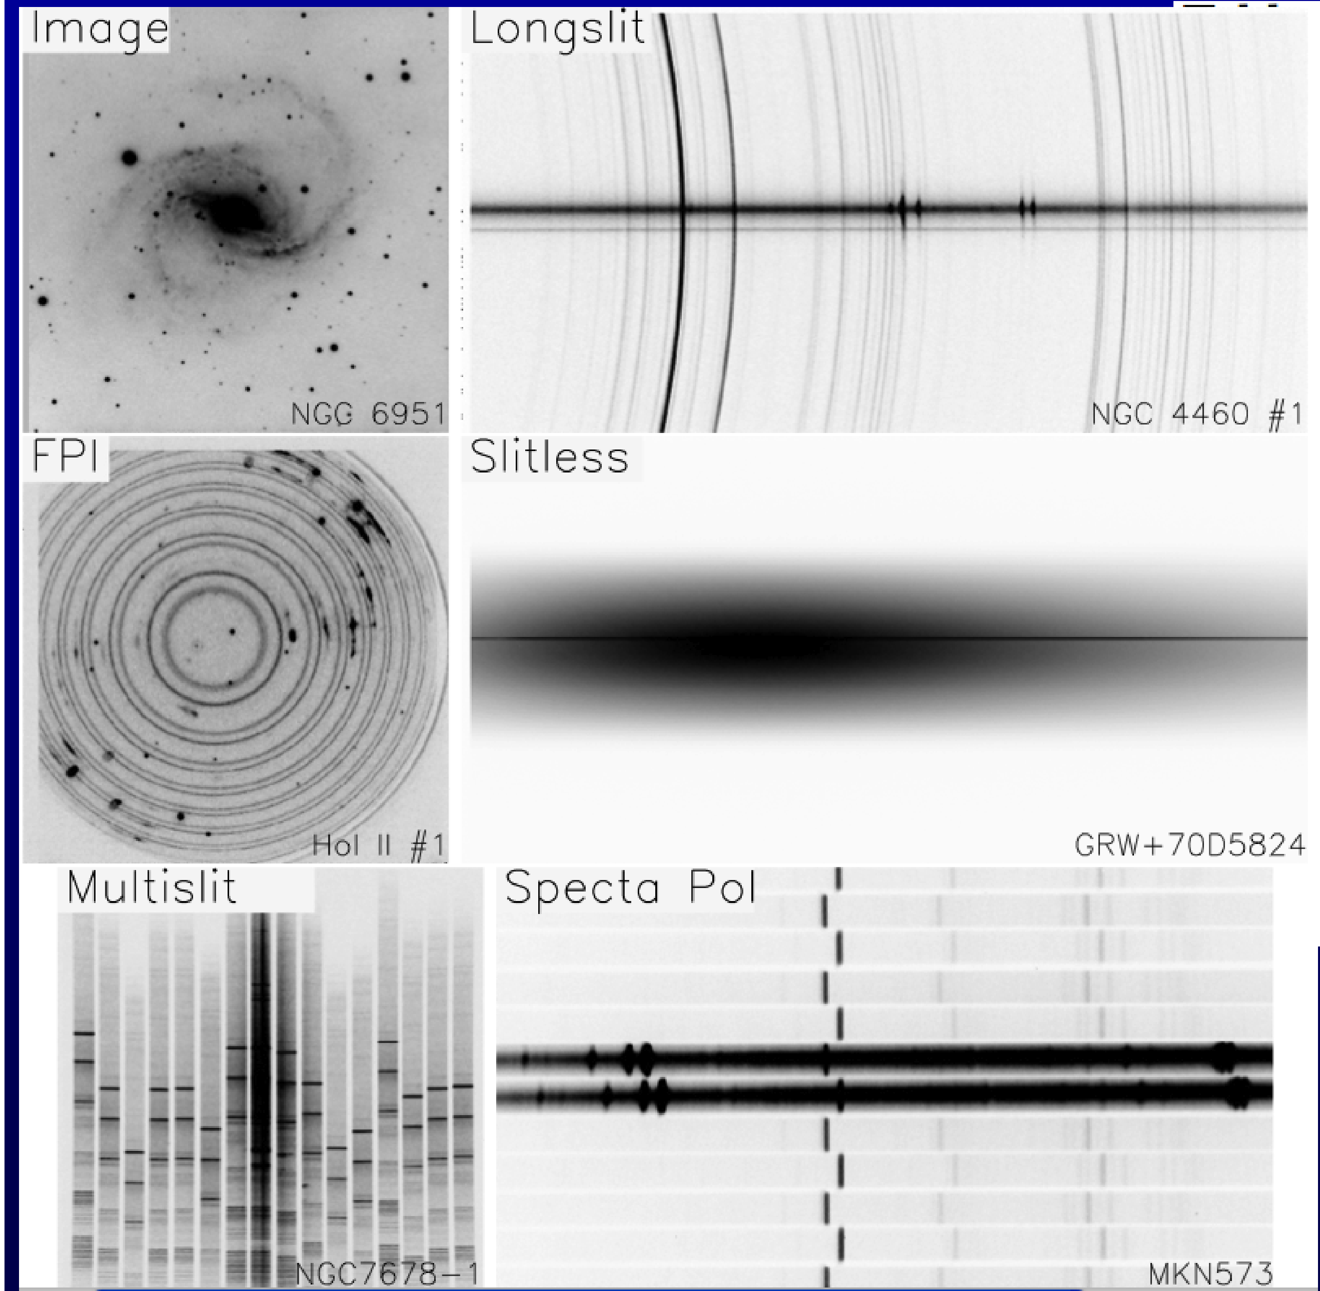
Observing modes in 6x6 arcmin field-of-view:

1. Direct imaging (broad-band and narrow-band filters).
2. Long-slit spectroscopy (δλ=2-8 Å)
3. Slitless spectroscopy
4. Multi-object spectroscopy (16 slits)
5. 3D spectroscopy with Fabry-Perot interferometer.
6. Spectropolarimetry.



The first light: September, 2000

SCORPIO observing modes



1. The main characteristics of SCORPIO

Total focal ration	$F/2.6$
Field of view:	
full	$6.1' \times 6.1'$
in mutlsilit mode	$2.9' \times 5.9'$
Image scale	$0.18''/\mathrm{px}$
Spectral range	3 600 – 10 000Å
Spectral resolution	
with grisms	
(for slit width 1″)	1.5 – 20Å
with Fabry-Perot	
interferometers	0.8 – 2.5Å
Maximal quantum efficiency (telescope+SCORPIO +CCD)	
Direct imaging	70%
Spectroscopy	40%
Observations with FPI	20%

Afanasiev & Moiseev (2005)

The SCORPIO impact

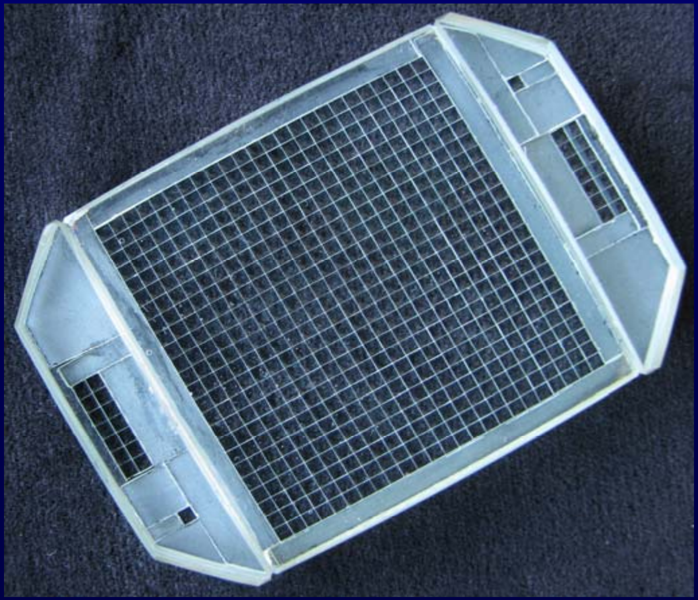
Smirnova & Moiseev (2010, MNRAS)

SCORPIO-2: what is new?

1. The device is specially designed to work under remote control from the Institute building (under the mountain where the telescope is sited): 27 filters, 9 VPH gratings

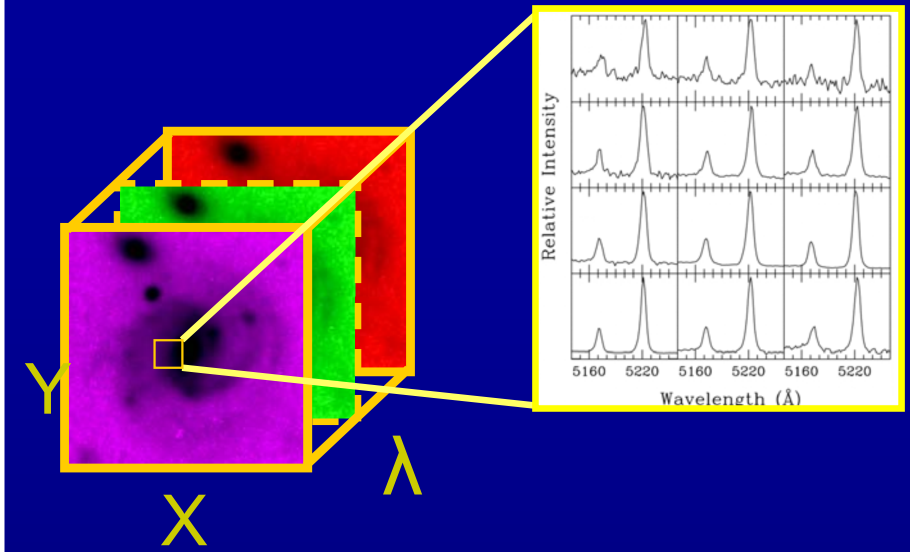
2. The opportunities for polarimetry (spectra and images) are greatly expanded.



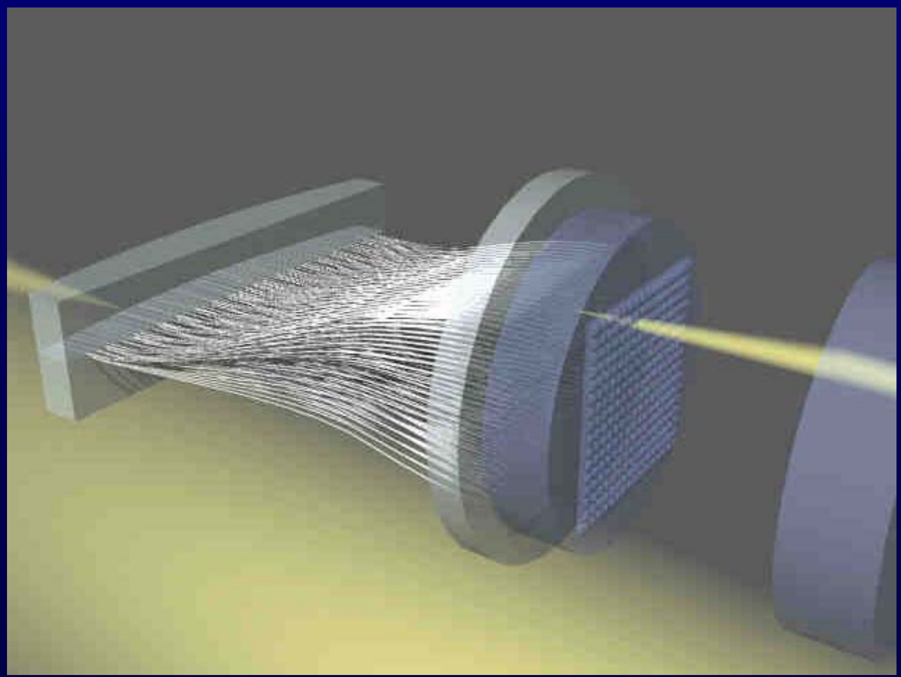
3. New optics for large-format (CCD 2Kx 4.6K), the value of off-axis optical aberration are significantly decreased.

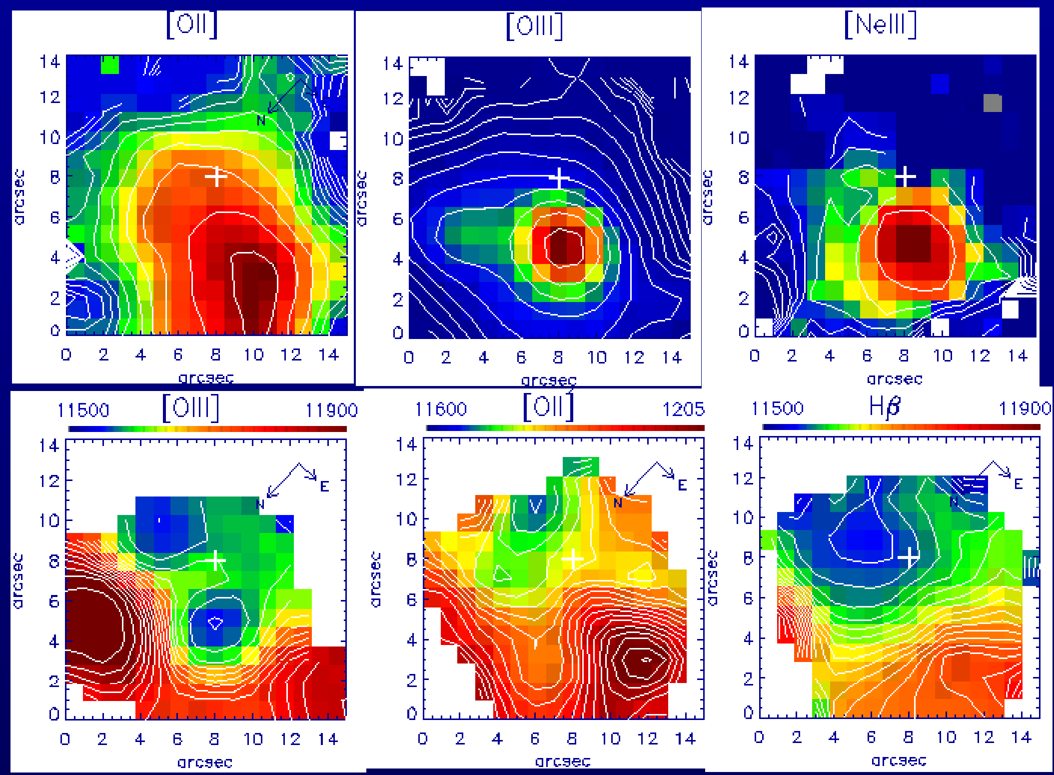
4. 3D integral-field unit: 24x24 lens array + fibers

SCORPIO-2/integral-field unit



The idea - Georg Courtes (1982)
The first realization:
MPFS at the 6-m telescope
(Afanasiev et al., 1990, 2001).





Mrk 315 (Ciroi et al., 2005, MNRAS)

The first light (spectra/images/FPI): June, 2010

2011 - test observations, software, integral-field and multislit units
2012 - regular observations at the telescope

Thank you for attention!
