

# **On the correlation between line-of-sight velocity and metallicity for nearby F, G, K stars**

---

**Sonja Vidojević & Slobodan Ninković**

[sonja@matf.bg.ac.yu](mailto:sonja@matf.bg.ac.yu)   [sninkovic@aob.bg.ac.yu](mailto:sninkovic@aob.bg.ac.yu)

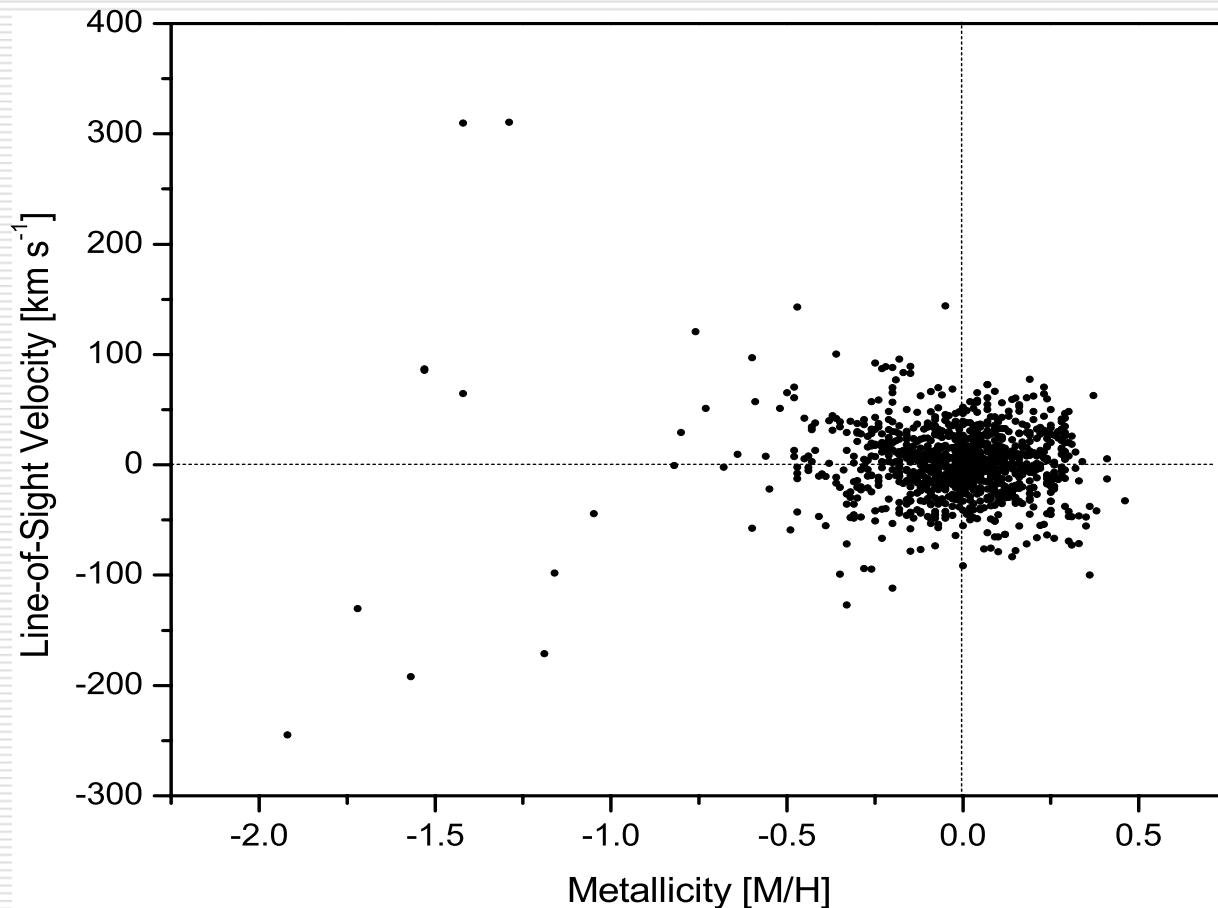

**VI Serbian Conference on Spectral Line Shapes in Astrophysics  
Sremski Karlovci, Serbia, June 11-15 2007**

# Treated data

---

- Spectroscopic data from SPOCS  
(<http://vizier.u-strasbg.fr/viz-bin/VizieR>)
- Valenti J. A., Fischer D. A., 2005,  
ApJS, 159, 141
- 1040 stars including the Sun

# Line-of-sight velocity versus metallicity for all 1039 SPOCS stars.

# Percentages of galactic subsystems

---

- thin disc      93%
- thick disc     6%
- halo            1 %

# Thin disc

---

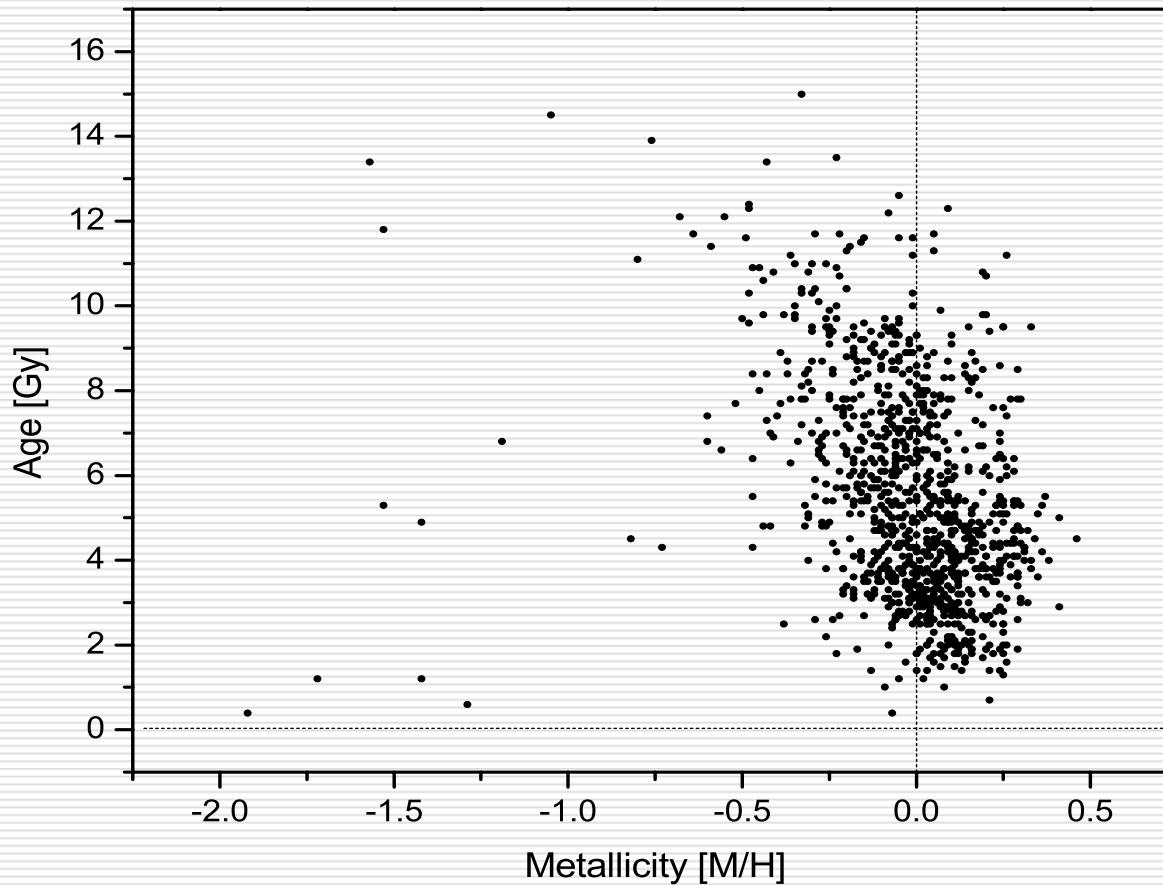

- ☐ Velocity ellipsoid determined on the bases of line-of-sight velocities

$v_\odot$	$L_\odot$	$B_\odot$	$\sigma_U$	$\sigma_V$	$\sigma_W$	$l_V$
25	70°	19°	34	22	17	6°

- First three yield Solar motion and the last one is vertex deviation

# Age-metallicity relation

---

# Thick disc

---

- On the average less metallic than thin disc
- Higher heliocentric velocities than in thin disc
- On the average age seems to be higher than in thin disc

# Halo

---

- Separated most clearly
- Halo stars in this sample least metallic       $\leq -0.8$
- Highest moduli of line-of-sight velocities
